Your teacher is talking about **Bloom's Taxonomy**.
It is a **thinking-level structure** used to judge *how deep* your answer is — not just *how long* it is.

When you write a **12-mark answer**, the examiner expects **all five levels** to appear **in order**.

Meaning of

Remember – Understand – Apply – Analyze – Evaluate

I'll explain **in simple exam language**, not theory-heavy.

---

1 Remember (Recall)

Meaning

This level checks **whether you remember facts and definitions**.

What you write in exam

- Definition
- Meaning
- Basic terms

Example (Multiple Inheritance)

Multiple inheritance is a concept in which a class inherits properties from more than one parent class.

☞ This shows **memory**.

---

2 Understand (Explain)

Meaning

This level checks **whether you understand the concept** and can explain it in your own words.

What you write

- Explanation

- Description
- How it works

Example

In multiple inheritance, a child class tries to inherit methods and variables from two or more parent classes, which can create confusion if parents have similar methods.

☞ This shows **understanding**.

---

3 Apply (Use)

Meaning

This level checks **whether you can use the concept** in a real or programmatic situation.

What you write

- Example
- Code snippet
- Diagram / scenario

Example

```
class C extends A, B { }   // not allowed
```

☞ This shows **application**.

---

4 Analyze (Break & Compare)

Meaning

This level checks **whether you can break the concept into parts and find problems or relationships**.

What you write

- Why it fails
- What problem occurs
- Compare scenarios

Example

If both parent classes contain a method with the same name, the compiler cannot decide which method to call, leading to ambiguity.

☞ This shows **analysis**.

---

5 Evaluate (Judge & Conclude)

Meaning

This level checks **whether you can judge the concept and justify a decision**.

What you write

- Why Java supports or avoids it
- Advantages / disadvantages
- Final conclusion

Example

Java avoids multiple inheritance using classes to reduce complexity and ensure compile-time safety, making programs more reliable.

☞ This shows **evaluation**.

How Examiner Sees a Full-Mark Answer □

Level	Examiner Thinks
Remember	Student knows basics
Understand	Student understands
Apply	Student can use it
Analyze	Student can think
Evaluate	Student can judge

☞ **Miss one level = marks cut**, even if answer is long.

One-Line Exam Tip ⭑

Definition + Explanation + Example + Problem + Justification = Full Marks
